## Science

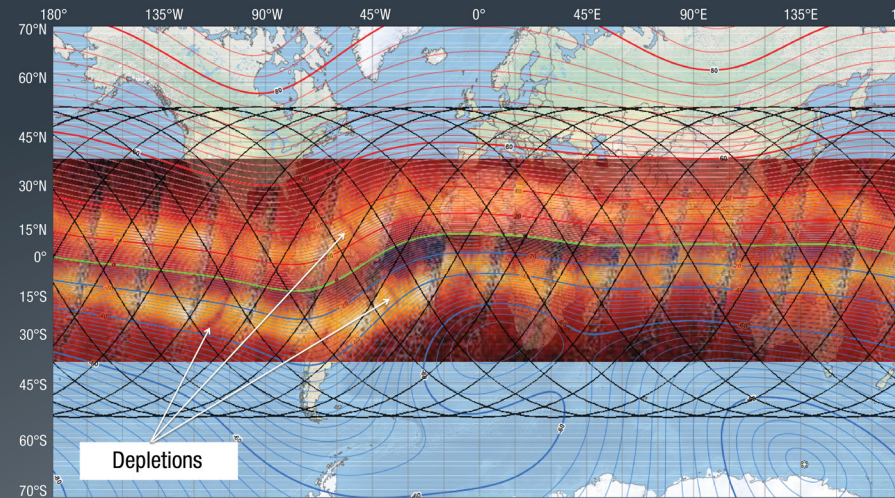

The Scintillation Prediction Observations Research Task (SPORT) mission tackles the very difficult problem of understanding the conditions under which ionospheric variability develops that leads to scintillation that compromises transmission signals. SPORT seeks to answer:

- What is the state of the ionosphere that gives rise to the growth of plasma irregularities that extend into and above the F-peak giving rise to scintillation?
- How do plasma irregularities impact the appearance of radio scintillation at different frequencies?

SPORT is science mission using a 6U CubeSat and integrated ground network that will (1) advance understanding and (2) enable improved predictions of scintillation occurrence that impact GPS signals and radio communications. This is the science of Space Weather. SPORT is an international partnership with NASA, U.S. institutions, the Brazilian National Institute for Space Research (INPE), and the Technical Aeronautics Institute under the Brazilian Air Force Command Department (DCTA/ITA).

The Scintillation Prediction Observations Research Task (SPORT)		Instrumentation	Spacecraft
Observational Approach	Science Measurement Requirements	Instrument Approach	Space Systems Requirements
<b>1. What is the state of the ionosphere that gives rise to the growth of plasma irregularities that extend into and above the F-peak?</b>			
Observations in the 17:00 to 1:00 LY sector over -30° to 30° latitude	<b>Plasma Density Profile</b> 1. 140 to 450 km alt 2. 10 <sup>4</sup> to 10 <sup>7</sup> p/cm <sup>3</sup> range 3. 20% p/cm <sup>3</sup> accuracy 4. 1000 km along track sampling	<b>GPS Occultation</b> Observe GPS satellite occultation along and to the sides of the orbit plane to obtain line of site TEC	<b>Satellite Orbit</b> 1. ≥1 year mission life 2. 40° to 55° inclination 3. 350 to 450 km altitude 4. ±10 km eccentricity
Height profiles of the plasma density to specify the magnitude and height of the F peak density in the EA	<b>Ion Drifts (Earth Reference Frame)</b> 1. ±800 m/s Range 2. 20 m/s precision & accuracy 3. 10 km along track sampling	<b>Ion Velocity Meter</b> Observe vertical ion drifts by angle of arrival of heavy ions at detector	<b>Spacecraft</b> 1. ±15° yer mission life 2. ≤1 km position knowledge 3. ≤10 ms timing
Vertical ion drifts at or below the F peak in the EA			
<b>2. How do plasma irregularities evolve to impact the appearance of radio scintillation at different frequencies?</b>			
Observations in the 22:00 to 2:00 LT sector over -30° to 30° latitude	<b>E-Field (Earth Reference Frame)</b> 1. ±45 mV/m range 2. 1.1 mV/m precision & accuracy 3. 1 km along track sampling 4. 10 km – 200 m along track waves	<b>E-Field Double Probe</b> Observe probe floating potential for AC E-fields from irregularity	<b>Spacecraft Mechanisms</b> 1. ≥0.6 m tip-to-tip booms <b>Attitude (Post Flight Knowledge)</b> 1. ≤0.02° 1σ-uncertainty
Observations of irregularities in electron density and E-field power spectral density in slope from 200 km to 200 m	<b>Plasma Density</b> 1. 10 <sup>3</sup> to 10 <sup>7</sup> p/cm <sup>3</sup> range 2. 10 <sup>3</sup> p/cm <sup>3</sup> precision & accuracy 3. 1 km along track sampling 4. 10 km – 200 m along track waves	<b>Langmuir/Impedance</b> Observe DC and AC probe response for relative and absolute electron density and observe irregularities	
	<b>B-field</b> 1. ± 56,000 nT range 2. ±100 nT precision and accuracy 3. 1 km along track sampling	<b>Three Axis Magnetometer</b> Support VxB computation for ion velocity and E-Field measurements	

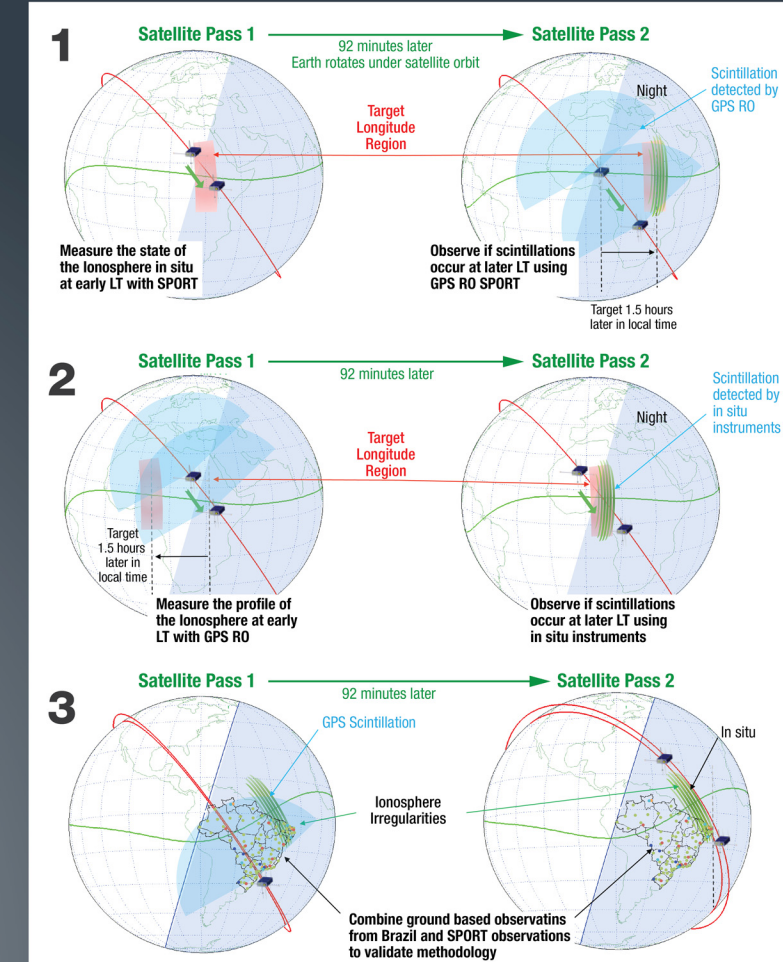

UV Airglow images from TIMED GUVI clearly showing the equatorial anomaly with embedded depletions that have penetrated through the F peak. Green, Red and Blue traces show the magnetic equator and positive and negative dip angles. SPORT 52° inclination ground tracks are superimposed as black traces.
